IoT pilot at EAMS Group with Yanzi and IBM

EAMS Group are global leaders in provisioning enterprise asset and safety management solutions. Yanzi Networks, a provider of an open wireless Internet of Things platform, has implemented a pilot together with IBM and EAMS Group at their Center of Excellence in London, United Kingdom.

"We have installed a pilot with 50 wireless sensors connected to our Enterprise Asset Management System IBM Maximo at our Center of Excellence in London. In the meeting rooms we have IP based sensors for motion, temperature and humidity. The data is fed into the enterprise asset management system so we can automate business processes and create work orders automatically," says David Gate, Product Delivery Consultant at EAMS Group.

"The solution is all-IP which means that all wireless sensors and the wireless sensor network are based on IP standard stacks. The unique properties include industry grade security, zero-touch-provisioning and automatic configuration, over-the-air upgradeability and data stream control mechanisms to the cloud", says Eva Fors, CEO of Yanzi Networks.

"The ambition is to leverage the outcome of the pilot in order to launch an IoT solution for facility management for EAMS Group's customers as an add-on to EAMS Group's Braid EAM solution", says Andrew Evans, CEO of EAMS Group.

"The sensor data will be integrated seamlessly into our solution, Braid EAM, for enterprise asset management. We hope to deliver a solution for better decision making based on automation and data transparency. This will drive our – and our customers - business to be more agile, reduce risk and improve the reliability of asset performance," says Sebastian Serrao, Commercial and Business Development Manager at EAMS Group.
